

Cellulose Media Rolls

Above: The various grades of cellulose media available.

Cellulose media rolls are commonly used beneath cutting machines to capture aluminium and metal swarf (sometimes washed away by suds or water). It can also be used in tanks and reservoirs to remove the larger debris from oil as it returns to the tank.

When ordering these items we need the following information:

- Core Size
- Width
- Roll Length
- Media Type (Samples are available for comparison purposes)

Several grades of media type, based on the level of filtration required, are available at Sterling Filtration Ltd.
